

Strongroom — Personal Workout Tracker

A private, dark earth-tone workout log. Tap the hollow circles to record reps (empty → 5 → 4 → 3 → 2 → 1 → empty). History, a calendar, and clipboard/PDF reports are built in. Your data lives in this repo's `data.json`, so every save is a git commit — you get permanent history and access from any device.

1. Put it online (one-time, ~3 minutes)

1. Create a new repository on GitHub named `workout-tracker` (Public is fine — your *data* is protected by your token, not the repo).
2. Upload `index.html` and `data.json` to the repo root.
3. Go to **Settings → Pages → Build and deployment**, set Source to **Deploy from a branch**, branch `main`, folder `/ (root)`, Save.
4. After ~30 seconds your app is live at: `https://rogerhunter00-afk.github.io/workout-tracker/`
5. Add it to your phone home screen (Share → Add to Home Screen) so it opens like an app.

2. Connect your data (one-time)

The app needs a token to read/write `data.json`.

1. GitHub → **Settings → Developer settings → Personal access tokens → Fine-grained tokens → Generate new token**.
2. **Repository access:** Only select repositories → `workout-tracker`.
3. **Permissions:** Repository permissions → **Contents → Read and write**.
4. Generate, copy the `github_pat_...` string.
5. In the app, open **Settings (gear)** and fill in:
 - GitHub username: `rogerhunter00-afk`
 - Repository name: `workout-tracker`

- Branch: `main`
- Token: *(paste)*
- Tap **Save & sync**.

The token is stored only in your browser, never in the repo. From now on every rep you log is committed automatically.

3. Using it

- **Circles** — tap to cycle reps. `+` / `-` add or remove a set.
- **Exercise row** — tap the name/weight to edit weight, sets, target reps, or remove it. Edits update the template so future days inherit them.
- **Workout A pill** — rename the session (Push Day, Legs, etc.).
- **Date arrows / Today** — move between days; tap the date to open the calendar.
- **Copy icon (top)** — copies that day's session as plain text.
- **Finish** — marks the session done and copies it to your clipboard.
- **Settings → Export** — full report to clipboard, or download a PDF.

4. Letting Claude push edits

When you want a change (new feature, tweak, fix), ask Claude. Claude returns an updated `index.html` ; replace the file in the repo (or have Claude commit it if you've connected the GitHub connector / given a token in-session). GitHub Pages redeploys in ~30 seconds. Your `data.json` is never overwritten by app updates — only the app shell changes.

Data model: `data.json` holds `settings`, `templates` (default exercises), and `workouts` keyed by date (`YYYY-MM-DD`). Each set is a number or `null` (a hollow circle). Safe to edit by hand if you ever want to.
